
RUDOLF J. KOHOUT

Ninety-one species of the genus Polyrhachis are recorded from the Queensland Wet Tropics. Fifty-nine of these represent previously described taxa and thirty-two are recognised as new. Polyrhachis doddi Donisthorpe is considered a junior synonym of P. australis Mayr and P. yarrabahensis Forel a junior synonym of P. lombokensis Emery. The genus Echinopla is represented by two species. Notes on synonymy and distribution are included. Hymenoptera, Formicidae, Polyrhachis, Echinopla, Australia, North Queensland, Wet Tropics, systematics, synonymy, distribution.

Rudolf J. Kohout, Queensland Museum, PO Box 3300, South Brisbane 4101, Australia; received 20 March 2000.

Polyrhachis is one of the world's largest and most distinct genera of ants, occurring mostly in the tropics and subtropics of the Old World. In Australia, it is one of the most common, diverse and widespread ant genera with 109 described valid species and with at least as many undescribed (Kohout & Taylor, 1990; Kohout, 1994, 1998). In contrast, the related Echinopla is a small genus represented in Australia by only two valid described species (Taylor, 1992) with limited distributions along the eastern coast of northern Queensland, and with one species, outside the Wet Tropics, undescribed. Both genera are characterised by monomorphism and are distinguished from the closely related Camponotus and Calomyrnx by their large first gastral tergite which forms at least half of the length of the gaster. The mesosoma and petiolar in Polyrhachis are usually armed with spines or teeth which, in Echinopla, are confined to the dorsum of the strongly transverse petiolar node (Bolton, 1994; Shattuck, 1999).

A variety of nests are constructed by Polyrhachis species. These may be subterranean (in burrows), terrestrial (beneath logs, stones etc.), lignicolous (in plant cavities) or arboreal (Hunig, 1967). Kohout (1999) summarised the range of nest types used by Australian Polyrhachis. Many species have the ability to use larval silk to construct nests incorporating plant debris or leaves. Hölldobler & Wilson (1990) discussed the significance of Polyrhachis nest behaviour in the evolution of silken nests in ants. Several nests of Wet Tropics species are shown in Fig. 3A-F.

The Wet Tropics World Heritage Area of North Queensland, Australia, stretches for about 450km along the coast between Cooktown (15°30'S) and Townsville (19°30'S). For the purposes of this paper I will follow Monteith (1995) and include Mt Elliot, a little beyond the southern boundary of the World Heritage Area proper. The Wet Tropics includes a complex series of subcoastal ranges and plateaus, with elevations often reaching 1,000-1,300m and attaining a maximum of 1,600m. The region enjoys a wet, tropical climate which, modified in parts by seasonal (monsoonal) and rainshadow effects, has induced a mosaic of tropical vegetation types ranging from fully developed rainforest to dry, open eucalypt woodlands. This small, but biologically diverse area harbours well over half of all known Australian species of Polyrhachis and Echinopla. These have been systematically collected at many localities over the last 20 years by the Queensland Museum and other institutions. This paper summarises those collections and lists 91 species of Polyrhachis and 2 of Echinopla from the area. Of these, 32 species are currently undescribed and 20 are endemic to the Wet Tropics.

Table 1 lists the species in their subgenera and summarises their distribution features including vegetation affinity, endemicity, altitudinal range, and geographic range both within the Wet Tropics and through a number of distributional zones outside the Wet Tropics.

SUBGENERIC SUMMARY. Nine subgenera of Polyrhachis occur in the Wet Tropics. These include all known Australian subgenera apart
from the nominal subgenus *Polyrhachis* which is restricted to monsoon rainforests on Cape York Peninsula, north of the 14°S parallel. The most speciose Wet Tropics subgenera are the more characteristic Australian subgenera, namely *Hagioemyrmca*, *Hedomyrmca* and *Chariomyrmca*, closely followed by the subgenus *Cyrtomyrmca*. The subgenera can be summarised as follows:

*Camponyrmca* is best developed in the south and west of Australia and is poorly represented in the Wet Tropics with 11 species including 2 undescribed. Most are at their northern limit and most occur at higher elevations. Five are restricted to elevations above 750m and 4 show significant disjunctions to the south.

*Chariomyrmca* is the least known Australian subgenus and has 22 species in the Wet Tropics, of which 9 are new. Most are ground nesting. Ten species are at their northern limits and 6 are endemics. Five are only found in lowlands and none are restricted to higher elevations.

*Cyrtomyrmca* are arboreal nesters which mostly occur in the lowlands. Of the 12 Wet Tropics species 4 are endemics, 4 are at their southern limit and 4 are at their northern limit. Their taxonomy is currently under review and 7 of the species are new.

*Hagioemyrmca* includes mostly ground-nesting, open forest species. Of the 19 species present, 10 are undescribed. Most are at higher elevations.

*Hedomyrmca* includes 20, mostly lignicolous, species of which 4 are undescribed and 5 are endemic. Ten are at their northern limits and 4 show significant disjunctions with southern populations. Most occur at moderate elevations.

The remaining 4 subgenera, *Myrmca*, *Myrmatopa*, *Myrmhopla* and *Myrmotherinax* contain mostly lowland, arboreal-nesting, rainforest species shared with New Guinea. With just 7 species between them reported from the Wet Tropics they represent only a shadow of their actual diversity which is centred in the South East Asian tropical rainforests.

**VEGETATION AFFILIATION.** On the basis of collection records, species have been scored in Table 1 as being rainforest restricted (R), open forest restricted (O), occurring in both rainforest and open forest (B), or mangrove restricted (M). More than half (49) of all species are open forest specialists while 36 species are restricted to rainforest and only 5 utilise both environments. The tidal environment of Wet Tropics mangroves have been invaded by 3 species of *Polyrhachis*, viz. *P. (Chariomyrmca) sokolova*, *P. (C.) constricta* and *P. (Hedomyrmca) machaon*.

**ALTITUDINAL RANGE.** The species have been scored in Table 1 under three elevational categories: low (L), below 200m; medium (M), from 200m to 750m; high (H), above 750m. Two thirds (64) of all species occur in the lowlands and a similar number (61) occur at medium altitude, but there is a rapid diminution above 750m where only 27 occur. Twenty one species are restricted to lowlands while 11 (7 open forest and 4 rainforest species) are found only in uplands. Only *P. (Hagioemyrmca) Hagio 04* and *P. (Hedomyrmca) erato* attain the highest elevations available in the region (such as the summits of 1,330m Thornton Peak and/or 1,620m Mt Bartle Frere) and are clearly high altitude specialists.

**ENDEMICITY.** Of the 20 species which are endemic to the Wet Tropics zone, two thirds (13) are rainforest species, 6 are open forest species and 1 is found in both vegetations. This is a much higher proportion of rainforest species than in the overall fauna. Most endemics are rather widespread within the Wet Tropics area, an exception being *P. (Hedomyrmca) Hedo 09* which is confined to Mt Elliot.

**EXTRA-LIMITAL DISTRIBUTION.** The distribution of the Wet Tropics species outside of the Wet Tropics area is shown in columns F-H and L-Q of Table 1. This information is summarised on the map in Fig. 1A. The strongest affinity of the fauna is to the south with 50 species shared with Central Queensland and 28 shared with southeast Queensland. Only 30 are shared with Cape York Pen. which is immediately adjacent to the north. The 12 species shared with New Guinea are almost all lowland, rainforest species which extend no further south than the Wet Tropics.

**DISJUNCT DISTRIBUTIONS.** A striking component of the Wet Tropics *Polyrhachis* fauna is a group of species which are shared with areas further south but which have substantial disjunctions between the two populations. These are typically high altitude wet sclerophyll species within the Wet Tropics which occur at localities along the western fringe of the mountain massifs such as Windsor Tableland, Mt Spurgeon, Hann Tbd, Baldy Mt and Evelyn Tbd. Disjunctions are frequently of the order of 500-700km to the Eungella/Mackay district (e.g. *P. cedarensis*, *P. femorata*, *P. miobergi* and *P. ornata*) but some
species have a greater disjunction of 950-1,200km to their nearest conspecific populations in southern Queensland (e.g. *P. 'Campo 02*', *P. 'Hagio 18'* and *P. rufifemur*). These disjunct distributions in ants clearly parallel similar disjunction in wet sclerophyll vertebrates such as the yellow-bellied glider (*Petaurus australis*) and the white-footed dunnart (*Sminthopsis leucopus*).

**DISTRIBUTION WITHIN THE WET TROPICS.** The Wet Tropics region is shown in Fig. 1B. The area has been divided arbitrarily into northern (north of Cairns), central (Cairns to Tully River) and southern (south of Tully River) sectors. It is also divided into the 17 mountain rainforest zones used by the Queensland Museum during survey collecting (Monteith, 1995). There has been reasonably thorough collecting of *Polyrhachis* within the region and it is unlikely that many more species will be discovered there. However it is clear that knowledge is still rather preliminary on the full distributions of species within the region. On a broad scale, totalling collecting records yields figures of 56 species (including 12 endemics) for the northern sector, 66 species (including 17 endemics) for the central sector, and 64 species (including 13 endemics) for the southern sector. On a narrower scale the species numbers for each of the 17 survey zones are shown in Fig. 1B with maxima of 28, 28 and 27 species being achieved for Zones 1, 15, and 19, respectively. This does not accord with result totals for flightless Coleoptera and
TABLE 1. List of species of *Polyrhachis* and *Echinola* recorded from the Wet Tropics region. Undescribed species are referred to by Voucher Codes as used in the Queensland Museum collection. Columns A-Q indicate distributional characteristics as follows: Column A: Vegetation Affiliation - R, rainforest only; O, open forest only; B, both rainforest and open forest; M, mangroves only. Column B: Endemicity - E, endemic (restricted) to the Wet Tropics. Columns C - E: Altitudinal Occurrence - C, below 200m (L); D, 200-750m (M); E, above 750m (H). Columns F-P: North/South Distribution where presence indicated by X - F, Indonesia; G, New Guinea; H, Cape York Peninsula, north of Cooktown; I, northern Wet Tropics (Cooktown to Barron River); J, mid Wet Tropics (Cairns to Tully); K, southern Wet Tropics (Tully to Mt Elliot); L, Central Queensland (Mt Elliot to Rockhampton); M, Southeast Queensland (south of Rockhampton); N, New South Wales; O, Victoria; P, Tasmania. Q, western distribution (Northern Territory) indicated by X.

</tbody>
</table>
Hemiptera for the same zones which yielded maxima for Zones 4, 7 and 11 (Monteith, 1995). However, Monteith included only rainforest taxa in that study. For *Polyrhachis* the inclusion of open forest elements obscures the rainforest pattern. The rainforest-only figures for *Polyrhachis* in the survey zones are shown in parentheses in Fig. 1B. The figures for *Polyrhachis* are probably also skewed because of high species numbers having been obtained from certain key localities where repeated collections have been made. Figures for these localities are entered on Fig. 1B. These maxima of 26 for Mt Elliot, 19 for Cape Tribulation, 18 for Home Rule, 15 for Chewko Road and 17 for Kirrama may be approaching complete lists for these particular sites because of the intensity of collecting undertaken.

**METHODS**

Synonyms of individual species are listed only where relevant to the context of this paper. For full synonymy citations see Bolton (1995), Dorow (1995) and Kohout (1998).

Unless otherwise indicated, all locality data listed below refer to the Queensland Wet Tropics area as delimited by Monteith, 1995 (see Fig. 1B). The numbering of voucher specimens representing new species (e.g. ‘*Campo 01’, ‘Hedo 05’, etc.) corresponds with the system used in the *Polyrhachis* study collection in the Queensland Museum, Brisbane. Most of the material listed is lodged in the QMBA and/or ANIC collections.

*Abbreviations*. Collectors: CJB, C. J. Burwell; DJC, D. J. Cook; JPH, J. & P. Hasenpusch; HJ, H. A. Janetzki; RJK, R. J. Kohout; BBL, B. B. Lowery; GBM, G. B. Monteith; SKR, S. K. Robson; RWT, R. W. Taylor; GT, G. I. Thompson. Other abbreviations used in specimen data are: Bch, Beach; Ck, Creek; I., Island; JCU, James Cook University; NP, National Park; Pen., Peninsula; R., River; Ra., Range; Rd, Road; SF, State Forest; Tbld, Tableland; w, worker/s; Xing, Crossing.

Institutions (with the names of cooperating curators) are: ANIC, Australian National Insect Collection, Canberra, Australia (Drs S.O. Shattuck, R.W. Taylor); BMNH, The Natural History Museum, London, U.K. (Barry Bolton, C. Taylor); HNHM, Hungarian Natural History Museum, Budapest, Hungary (Dr J. Papp); MCSN, Museo Civico di Storia Naturale ‘Giacomo Doria’, Genoa, Italy (Drs R. Poggio, V. Raineri); MHNG, Museum d’Histoire Naturelle, Geneva, Switzerland (Drs C. Besuchet, I. Löbl, B. Merz); MNHU, Museum für Naturkunde, Humboldt-Universität, Berlin, Germany (Dr F. Koch); MVMA, Museum of Victoria, Melbourne, Australia (Dr A. Neboiss); NHMB, Naturhistorisches Museum, Basel, Switzerland (Dr M. Brancucci); NMHM, Naturhistorisches Museum, Vienna, Austria (Drs M. Fischer, S. Schödl); NRMS, Naturhistoriska Riksmuseet, Stockholm, Sweden (Drs K-J. Hedqvist, F. Ronquist); OXUM, Hope Entomological Collections, University Museum, Oxford, U.K. (Dr C. O’Toole); QMBA, Queensland Museum, Brisbane, Australia (Drs C.J. Burwell, G.B. Monteith).

**Genus Polyrhachis** Fr. Smith, 1857
Subgenus *Camponymma* Wheeler, 1911

**Polyrhachis (Camponymma) cedarensis** Forel, 1915

**Material**. Cedar Ck nr Ravenshoe (E. Mjöberg) (*leae cedarensis* syntype series MHNG) (*w, 2*).

**Remarks**. The syntypes are the only specimens of *P. cedarensis* I have seen from the Wet Tropics area. This species has also been collected from Eungella NP, Finch Hatton Gorge (RJK acc. 75.172/2).

**Polyrhachis (Camponymma) creusa** Emery, 1897
(Fig. 4A)

*Polyrhachis creusa* Emery, 1897: 577.

(For full synonymy citations see Kohout & Taylor, 1990: 514 and Kohout, 1998: 506.)

**Remarks**. *Polyrhachis creusa* is a ground-nesting species, predominantly in wet sclerophyll and rainforest. It ranges from the Bismarck Archipelago to northern Australia where it has been collected near Darwin in the Northern Territory and in Queensland from Cape York Pen. south to Mackay.

**Polyrhachis (Camponymma) femorata** Fr. Smith, 1858

*Polyrhachis femoratus* Fr. Smith, 1858: 73.
MATERIAL. Windsor Tbd, NW, 16°13'S, 144°59'E, 1100m, 23-24.xi.1997 (GBM, DJC & CJB) (w); Baldy Mt Rd, 17°20'S, 145°25'E, 1130m, 30.xi.1997-S.ii.1998 (GBM, DJC & CJB) (w).

REMARKS. *Polyrhachis femorata* extends from about Mackay south to Victoria and Tasmania with a single collection in South Western Australia (S.J. Curry). The two workers from Baldy Mt Rd and a single worker from Windsor Tbd are remarkably similar to the other available material, and represent an isolated, disjunct population of this southern species in high altitude wet sclerophyll habitat in the Wet Tropics. It is an inhabitant of open *Eucalyptus* forests or, less commonly, wet sclerophyll forests. It is a lignicolous species which favours hollow tree branches as nesting sites.

**Polyrhachis (Campomyrina) flavibasis**
Clark, 1930

_Polyrhachis (Campomyrina) flavibasis_ Clark, 1930: 16.

MATERIAL. Windsor Tbd, 16°15'S, 145°02'E, 1060m, 8.i.1998 (GBM & DJC) (w); Hann Tbd (Nth End), 16°49'S, 145°11'E, 950-1000m, 11-14.xi.1995 (GBM, GT & DJC) (w); Atherton Tbd, Yungaburra distr., Gadgarra SF, iv.1996 (A. Cutter & J. King) (w); Kenny Rd, 17°28'S, 145°32'E, 850m, 25.xi.1994-10.i.1995 (GBM & JPH) (w); Millaa Millaa Falls, 17°30'S, 145°37'E, 16.v.1995 (GBM) (w).

REMARKS. Originally described from Brooklana and Dorrigo on the northern NSW coast, _P. flavibasis_ ranges northward along the eastern slopes of the Great Dividing Range. It appears that the northern borders of the Wet Tropics is its northern limit. It is a rainforest dwelling species nesting in various plant cavities, such as hollow twigs and small tree branches.

**Polyrhachis (Campomyrina) inconspicua**
Emery, 1887

REMARKS. *Polyrhachis inconspicua* is a widespread species extending from Barrow I. in Western Australia, across the Northern Territory to Queensland where it has been collected from Torres Strait islands south to about Mackay. I have not seen any specimens of this species from the Wet Tropics area proper, however, Taylor (1989:24-25) lists its distribution from 1-degree grid cells 16/145, 17/145 and 18/146 which are all within the designated area.

**Polyrhachis (Campomyrina) insularis**
Emery, 1887

MATERIAL. Capt. Cook Hwy, c. 10km NW of Ellis Bch, 16°40'S, 145°34'E, 8.vii.1996 (RJK et al. acc. 96.33) (w); Kamerunga, 10km NW of Cairns, 16°53'S, 145°41'E (ANIC coll.) (w); Chewko Rd, 2-3km SW of Mareeba, 17°01'S, 145°24'E, 23-25.i.2000 (RJK et al. acc.2000.44) (w).

REMARKS. This species ranges from New Guinea south to the Northern Territory and from Torres Strait islands and Cape York Pen. south to southern Queensland. It is a ground-nesting species restricted to open forests and woodlands.

**Polyrhachis (Campomyrina) io**
Forel, 1915

REMARKS. Two workers collected along Chewko Rd are the only known specimens of this rare species from Queensland. They match closely the vouchers of _P. io_ in ANIC and QMBA (Katherine Gorge, NT, 12.vii.1986, A.N. Andersen). The type series was collected at Derby in north-western Australia by Eric Mjöberg. The only other records came more recently from Kununurra in Western Australia (J.D. Majer) and from Katherine Gorge in Northern Territory (BBL).

**Polyrhachis (Campomyrina) polynina**
Forel, 1902

_Polyrhachis polynina_ Forel, 1902: 532.

REMARKS. A single specimen is the only record of _P. polynina_ from the Wet Tropics. This rare species was originally described from Mackay and, besides the types, it is known from a few additional collections (Conway Ra., Brandy Ck Rd, RJK, and Cedar Ck Falls, 15km SE Proserpine, BBL). It is very similar to _P. maculata_ Forel and their relationship was discussed by Taylor (1989: 25).
Polyrhachis (Campomyrma) prometheus
Santschi, 1920

Polyrhachis (Campomyrma) prometheus Santschi, 1920: 566.

MATERIAL. Chewko Rd, 2-3km SW of Mareeba, 17°01'S, 145°24'W, 23-25.ii.2000 (RJK et al. acc. 2000.42) (w); Townsville (F.P. Dodd) (prometheus syntype series NHMB) (w); Townsville Field Training area/Tabletop, 19°27'S, 146°24'E, ii.1999 (A. Ash #76) (w).

REMARKS. Polyrhachis prometheus is an uncommon, ground-nesting, species of open sclerophyll forests. It occurs patchily from Groote Eylandt in the Northern Territory to Croydon in the Queensland Gulf Country and from Mareeba south to Rundle Ra. near Gladstone.

Polyrhachis (Campomyrma) sp.
(‘Campo 01’)

*Polyrhachis (Campomyrma) micans r. ops var. rufa’ Crawley, 1921: 97.
*Polyrhachis (Campomyrma) micans ops rufa’ Crawley; Taylor, 1986: 34. Unavailable name.

MATERIAL. Townsville, 11.xii.1902 (F.P. Dodd #203) (w of the original series in ANIC, BMNH and QMBA).

REMARKS. The original series of the quadri-nominal infraspecies *P. (Campomyrma) micans ops rufa’ was allegedly collected by F.P. Dodd at Townsville in the early 1900s. However, I have seen no specimens from elsewhere in Queensland. The only recent records of this rare species are from Nourlangie Rock, Kakadu NP (RJK) and Groote Eylandt (A.N. Andersen) in the Northern Territory. Since Dodd collected around Darwin himself in 1908/09 (Monetheit, 1991) the Townsville record may be erroneous.

Polyrhachis (Campomyrma) sp.
(‘Campo 02’)

MATERIAL. Windsor Tbl, NW, 16°13'S, 144°59'E, 1100m, 23-24.xi.1997 (GBM, DJC & CJB) (w); Mt Spurgeon, 4km NNE of Stewart Ck, 16°24'S, 145°13'E, 1250-1300m, 15-20.x.1991 (GBM, DJC, HJ & L. Roberts) (w); ditto, 1200-1250m, 17-19.x.1991 (ditto) (w); Carbine Tbl, 1330m, 27-28.xi.1990 (GBM, GT, DJC, R. Sheridan & HJ) (w); Tully, xi.1991 (P. Stumkat) (w).

REMARKS. This new species is intermediate between P. femorata Fr. Smith and P. flavibasis Clark. It is apparently an inhabitant of higher altitude, mostly wet sclerophyll forests, and has also been recorded from Dawes Ra., D’Aguilar Ra., Tamborine Mt. and Lamington NP in south-eastern Queensland. Its occurrence in the Wet Tropics is a disjunction of 900km from the southern localities.

Subgenus Chariomyrma Forel, 1915

Polyrhachis (Chariomyrma) consticta
Emery, 1897

Polyrhachis consticta Emery, 1897: 584 (footnote).

MATERIAL. Low L, 16°23’S, 145°33’E, 14.viii.1954 (M.J. Mackerras & E.N. Marks) (w); Bellenden Ker (M. Podenzana) (consticta holotype w MCSN).

REMARKS. Polyrhachis consticta was described from a specimen collected at Bellenden Ker but, besides the holotype and a single specimen from each of Horn and Low Islands, I have not seen other specimens from Queensland. However, in recent years the species has been more frequently collected in the Northern Territory (A.N. Andersen, RJK). It closely resembles small specimens of P. sokolova (var. degener) and the two are sympatric in suitable localities in northern coastal mangrove forests.

Polyrhachis (Chariomyrma) cyrus
Forel, 1901

Polyrhachis cyrus Forel, 1901: 32.

MATERIAL. Mt Molloy, 14.xi.1981 (BBL) (w); Chewko Rd, 2-3km SW of Mareeba, 17°01’S, 145°24’E, 23-25.ii.2000 (RJK et al. acc. 2000.43) (w); Mt Elliot NP, 25.v.1980 (BBL) (w); Alligator Ck, Bowling Green Bay NP, 19°26’S, 146°57’E, 2.vi.1996 (RJK et al. acc. 96.9) (w).

REMARKS. The relationships of *P. cyrus* and its Australian form described by Forel in 1902 as *P. urania* was discussed by Kohout (1998:511). This is an uncommon species ranging from the Bismarck Archipelago and mainland Papua New Guinea to Queensland where it has been infrequently collected as far south as Fraser Island. It favours moist areas in open forests or rainforest edges. It nests in the ground with the entrance usually covered with a rock or piece of wood.

Polyrhachis (Chariomyrma) gab Forel, 1879

Polyrhachis gabemeri r. gab Forel, 1879: 116.

Polyrhachis gab Forel: Dalla Torre, 1893: 262. Raised to species.

MATERIAL. Hann Tbl (Nth Base), 16°48’S, 145°12’E, 500m, 11-14.xii.1995 (GBM, GT & DJC) (w); Granite Gorge, 17°02’S, 145°21’E, 450m, 26.x.1997 (GBM, DJC & CJB) (w); Townsville, 13.vii.1994 (F.C. Bishop) (w); Mt Elliot NP, Alligator Ck, 19°26’S, 146°57’E, 2.ix.1977 (RJK acc. 77.8) (w).
REMARKS. *Polyrhachis gab* is the least common species of the *gab* species-complex. Its distribution extends across northern Australia from the Northern Territory to Queensland, where it is known from the Gulf Country and Cape York Pen. and as far south as Mt Elliot. It is predominantly a ground-nesting species, mostly in open sclerophyll forests and savannah woodlands. For comments on biology, distribution and synonymy see Kohout (1988a: 49-51).

*Polyrhachis* (Charismyrma) heinlethii
Forel, 1895

*Polyrhachis* heinlethii Forel, 1895: 47.

MATERIAL. Capt. Cook Hwy, c. 10 km NW of Ellis Bch, 16°40'S, 145°34'E, 8. vi. 1996 (RJK et al. acc. 96.33) (w).

REMARKS. The single specimen collected just north of Cairns is the only record from the Wet Tropics and extends the range of this species as listed by Kohout & Taylor (1990:514) by more than 500 km. It is a ground-nesting species from open forests and woodlands, common in suitable localities from Mackay to southern Queensland.

*Polyrhachis* (Charismyrma) hookeri
Lowne, 1865

*Polyrhachis* hookeri Lowne, 1865: 334.

MATERIAL. Forty Mile Scrub, 18°05'S, 144°53'E, 5.v.1990 (BBL) (w); Kirrama Ra., nr JCU Field Stn, c. 600m, 18°11'S, 145°44'E, 4.vi.1996 (RJK et al. acc. 96.15) (w); Hervey Ra., Turtle Rock area, 19°24'S, 146°31'E, c. 500m, 3.vi.1996 (RJK et al. acc. 96.11) (w); Mt Elliot NP, Alligator Ck, 19°26'S, 146°57'E, 11.vi.1987 (RJK acc. 87.91) (w).

REMARKS. This common species was described from Sydney and reaches its northern limit within the Wet Tropics. The specimens from Forty Mile Scrub differ somewhat from the other available material, however, for the purpose of this paper I regard them as an isolated population of *P. hookeri*. This species lives in open sclerophyll forests and woodlands where it nests either in the soil under rocks or logs, between grass roots or, occasionally, in pieces of decaying wood lying on the ground.

*Polyrhachis* (Charismyrma) lata
Emery, 1895

*Polyrhachis guerini* subsp. *lata* Emery, 1895: 357.

MATERIAL. Annan R. Xing, 3 km SE, 15°33'S, 145°14'E, 10.vi.1996 (RJK acc. 96.35) (w); Home Rule, 15°45'S, 145°17'E, c. 200m, 9-11.vi.1996 (RJK et al. acc. 96.43) (w); Black Mtn Rd, 4 km N of Kuranda, 16°47'S, 145°38'E, 21.vii.1980 (RJK acc. 80.102) (w); Stratford, Cairns, 16°53'S, 145°44'E, 10.viii.1989 (RJK acc. 89.4) (w); Atherton (E. Mjöberg) (gab aegra syn typte w MHNG NRMS); Bell Peak North, Malbon Thompson Ra., 17°05'S, 145°53'E, 800-900m, 19-22.xi.1990 (GBM & GT) (w); Mill Ck, above, 17°30'S, 145°37'E, 1000m, 5.ii.1999 (GBM & DJC) (w); Sth Mission Bch, 10km WbyN, 17°56'S, 146°00'E, 18-19.viii.1980 (RJK acc. 80.51) (w); Cardwell Ra., Murray R. Falls, 18°09'S, 145°49'E, 1-5.vii.1983 (RJK acc. 83.4) (w); Kirrama Ra., nr JCU Field Stn, c. 600m, 18°11'S, 145°44'E, 4.vi.1996 (RJK et al. acc. 96.15) (w); Hinchinbrook I., Gayundah Ck, 18°21'S, 146°14'E, <100m, 8-18.xi.1984 (GBM) (w); Cardwell Gap, 18°32'S, 146°11'E, 120m, 4-12.i.1998 (GBM & DJC) (w); Hervey Ra., Turtle Rock area, 19°24'S, 146°31'E, 3.vi.1996 (RJK et al. acc. 96.43) (w); Mt Elliot NP, Alligator Ck, 19°26'S, 146°57'E, 2.x.1977 (RJK acc. 77.4) (w).

REMARKS. *Polyrhachis lata* mostly occurs in open forests and savannah woodlands, but has also been collected in rainforest and wet sclerophyll forest. It is known from Torres Strait south to Rundle Ra. near Gladstone.

*Polyrhachis* (Charismyrma) lownei
Forel, 1895

*Polyrhachis* hookeri t. *lownei* Forel, 1895: 44.

MATERIAL. Windsor Tbd, SE, 16°18'S, 145°05'E, 850m, 9-17.v.1998 (GBM & DJC) (w); Hann Tbd Radar Stn, 16°55'S, 145°15'E, 950m, 26-27.xi.1998 (GBM, P. Bouchar & A. O'Toole) (w); Kuranda, 10mi W, 3.viii.1975 (BBL) (w); Kirrama, 15.iv.1976 (P.J.M. Greenslade) (w); Kirrama Ra., nr JCU Field Stn, c. 600m, 18°11'S, 145°44'E, 4.vi.1996 (RJK et al. acc. 96.15) (w); Mt Spec, 5mi W of summit, 14.vii.1975 (BBL) (w).

REMARKS. This is an uncommon species which has been infrequently collected at higher altitude wet sclerophyll or rainforest localities. It ranges patchily from Windsor Tbd south to Mackay.

*Polyrhachis* (Charismyrma) obscura
Forel, 1895

*Polyrhachis* hookeri t. *obscura* Forel, 1895: 44.

MATERIAL. Mt Elliot NP, above St Margaret Ck, c. 350m, 27.vii.1980 (BBL) (w).

REMARKS. *Polyrhachis obscura* is evidently very rare and, apart from the types collected at
Mackay, the short series from St Margaret Ck are the only specimens known to me.

**Polyrachis (Chariomyrma) punctiventris**
Mayr, 1876

*Polyrachis punctiventris* Mayr, 1876: 73.

**MATERIAL.** Hervey Ra., Turtle Rock area, 19°24' S, 146°31'E, c.500m, 3.vi.1996 (RJK et al. acc. 96.11) (w).

**REMARKS.** This is the only record of *P. punctiventris* from the Wet Tropics. It is relatively rare with a patchy distribution from Townsville south to near Maryborough in southeastern Queensland. It is a ground-nesting inhabitant of open forests.

**Polyrachis (Chariomyrma) schoopae**
Forel, 1902
(Figs 2A, 4B)

*Polyrachis appendiculata r. schoopae* Forel, 1902: 520.

Raised to species.

**MATERIAL.** Roaring Meg Valley, 16°04'S, 145°25'E, 680m, 20.xi.-9.xii.1993 (GBM) (w); Pilgrim Sands, NE of Cape Tribulation, 16°04'S, 145°28'E, 25.viii.1988 (R. Raven, Churchill & J. Gallon) (w); Mt Hemmant, 6km SW of Cape Tribulation, 16°06'S, 145°24'E, 25.iv.1983 (GBM & DJC) (w); Yarrabah, c. 9km E of Cairns, 16°54'S, 145°51'E, 22-24.vii.1980 (RJK acc. 80.117) (w); Harn Tbld Radar Sth, 16°55'S, 145°15'E, 800-900m, 8.i.1996 (GBM) (w); Atherton Tbld, Yungaburra distr., Centre for Rainforest Studies, iv.1996 (A. Cutler & J. King) (w); Hervey Ra., Turtle Rock area, 19°24'S, 146°31'E, c. 500m, 3.vi.1996 (RJK et al. acc. 96.11) (w).

**REMARKS.** *Polyrachis schoopae* is predominantly a rainforest or wet sclerophyll forest dwelling species distributed from Cape Tribulation south to Mackay.

**Polyrachis (Chariomyrma) senilis**
Forel, 1902

*Polyrachis gab var. senilis* Forel, 1902: 520.

*Polyrachis senilis* Forel; Kohout, 1988a: 50. Raised to species.

(For full synonymy citations see Kohout, 1988a: 50).

**MATERIAL.** Helenvale, 15°42' S, 145°13'E, 10-20.vii.1976 (P. Filewood) (w); Davies Ck, 15km E of Mareeba, 17°00'S, 145°34'E, 15.vi.1980 (RJK acc. 80.27) (w); Chewko Rd, 2-3km SW of Mareeba, 17°01'S, 145°24'E, 23-25.ii.2000 (RJK et al. acc.2000.48) (w); Paluma, ix.1997 (B. Hoffman) (w); Mt Elliot NP, Alligator Ck, 19°26'S, 146°57'E, 2.x.1977 (RJK accs 77.3, 7) (w).

**REMARKS.** This species is restricted to northern Australia and ranges from the Kimberley district in Western Australia, across the Northern Territory toQueensland where it has been collected as far south as Newry I. near Mackay. It inhabits mainly open forests and savannah woodlands and is common at suitable localities. It nests mostly in the soil or in rotting logs. On Cape York Pen. it frequently nests in termite mounds of Amitermes or Nasutitermes species.

**Polyrachis (Chariomyrma) sokolova**
Forel, 1902
(Figs 2B, 3A)

*Polyrachis sokolova* Forel; Kohout, 1999: 221. Combination in *P. (Chariomyrma)*.

**MATERIAL.** Low I., 16°23'S, 145°33'E, 14.viii.1954 (M.J. Mackerras & E.N. Marks) (w); Port Douglas, 16°29'S, 145°28'E, 24.x.1982 (P. Davie) (w); Hinchinbrook I., Gayundah Ck, 18°21'S, 146°14'E, 8-18.x.1984 (GBM) (w); Round Hill Landing, c. 15km SE of Cardwell, 18°22'S, 146°07'E, 1.ix.1984 (GBM) (w); Magnetic I., Cockle Bay, 12.xi.1996 (SKR #118) (w); Townsville Town Common, Three Mile Ck, 20.viii.1995 (SKR #01) (w).

**REMARKS.** As discussed earlier (Kohout, 1988b:436, 1999:221) *P. sokolova* holds a unique position within the Australian ant fauna by building their nests in the mud of the intertidal zone. This remarkable nesting habit has recently been studied in Darwin Harbour in the Northern Territory (Nielsen, 1997). Its known distribution extends from eastern Indonesia and New Guinea to New Caledonia. In Australia it occurs along the northern and eastern coastline from the Bonaparte Archipelago in Western Australia to the Northern Territory and from Torres Strait south to Gladstone.

**Polyrachis (Chariomyrma) vermiculosa**
Mayr, 1876

*Polyrachis guerini* var. *vermiculosa* Mayr, 1876: 74.

*Polyrachis vermiculosa* Mayr; Kohout & Taylor, 1990: 520.

Raised to species.

**MATERIAL.** Ross R., 25.ix.1997 (A.J. King #001) (w); Townsville, Field Training area/Tabletop, 19°27'S, 146°24'E, ii.1999 (A. Ash #99) (w); Bowling Green Bay NP, ix.1997 (B. Hoffman) (w).

**REMARKS.** *Polyrachis vermiculosa* extends from northern Queensland south to Sydney in New South Wales. It is a common species in southeastern Queensland, but becomes less frequent north of the Tropic of Capricorn, with the northern limits of its distribution around Townsville.
Polyrhachis (Chariomyrma) sp.  
(‘Chario 01’)

MATERIAL. Mt Hartley, 15°46’S, 145°19’E, 500-700m, 11.vi.1996 (CJB) (w); Windsor Tbld SE, 16°18’S, 145°05’E, 850m, 9.i.17.vi.1998 (GBM & DJC) (w); Davies Ck, 15km E of Mareeba, 17°00’S, 145°34’E, 15.vi.1980 (RJK acc. 80.23) (w); Kurrera Ra, nr JCU Field Sbn, c. 600m, 18°11’S, 145°44’E, 4.vi.1996 (RJK et al. acc. 96.15) (w).

REMARKS. This is a spectacular new species structurally similar to the Australian P. schoopae Forel. However, its colour scheme gives it a striking resemblance to the New Guinean P. placiniata Emery. Its distribution appears limited to the Wet Tropics.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 04’)

‘Polyrhachis (Chariomyrma) hookeri obscura bellenendenensis’ Forel, Taylor, 1986: 34. Unavailable name.

MATERIAL. Mt Hedley, 1-2km N of Home Rule, 15°45’S, 145°17’E. 200-300m, 11.vi.1996, rainforest, RJK acc. 96.46 (w); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04’S, 145°28’E, <10m, 12-15.vi.1996 (RJK acc. 96.47) (w); McLean Ck, c. 19km Sby W of Cape Tribulation, 16°15’S, 145°26’E, 15.vi.1996 (RJK acc. 96.54) (w); Bellenden Ker (E. Mjöberg) (‘hookeri obscura bellenendenensis’ unique w NRMS); Mission Bch, 17°45’S, 146°00’E, 1996 (SKR #799) (w); Rocky Ck Xing, 6km W of Tully, 17°55’S, 145°53’E, 22.ix.1980 (BBL) (w); Broadwater Park, via Ingham, 18°22’S, 145°57’E, 400m, 3.i.1987 (S. Hamlet) (w).

REMARKS. This species was originally described from a unique specimen collected by Eric Mjöberg on Bellenden Ker. However, as it was described as a quadrinomen, the name is unavailable. It is a relatively common, rainforest-dwelling species, apparently endemic to the Wet Tropics.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 05’)

MATERIAL. Chewko Rd, 2-3km SW of Mareeba, 17°01’S, 145°24’E, 23-25.ii.2000 (RJK et al. acc.2000.48) (w); Forty Mile Scrub, 18°05’S, 144°53’E, 5.v.1990 (BBL) (w); Hervey Ra., Turtle Rock area, 19°24’S, 146°31’E, c. 500m, 3.vi.1996 (RJK et al. acc. 96.11) (w); Alligator Ck, Bowling Green Bay NP, 19°26’S, 146°57’E, 2.vi.1996 (RJK et al. acc. 96.9) (w).

REMARKS. This new species is related to P. lata Emery. It differs by the distinctly less rugose pronotal dorsum and the metathoracic spiracles situated on prominent, posteriorly projecting tubercles, not unlike those in P. tubifera Forel or P. stigmatifera Kohout. Additional records outside the Wet Tropics are from Cape Hillsborough, Britton Ra., Rockhampton and as far south as Cooloola NP, north of Brisbane.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 06’)

MATERIAL. Mt Hartley, 15°46’S, 145°19’E, 200-500m, 11.vi.1996 (CJB) (w); Atherton Tbld, Yungaburra district, Donaghy’s Corridor, iv.1996 (A. Cuttle & J. King) (w).

REMARKS. This species appears intermediate between P. obscura Forel and P. ‘Chario 04’ above. It appears to be endemic to the Wet Tropics.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 08’)

MATERIAL. Black Mtn, NW base, 15°40’S, 145°13’E, 10.vi.1996 (CJB) (w); Bakers Blue Mtn, 17km W of Mt Molloy, 12.ix.1981 (GBM & DJC) (w); Hann Tbld, 16°48’S, 145°12’E, 500m, 11-14.xii.1995 (GBM, GT & DJC) (w); Wallaman Falls, 18°35’S, 145°48’E, 28.ix.1987 (RJK acc. 87.100) (w).

REMARKS. This is a new species with some similarity to P. ‘Chario 05’. However, it lacks the projecting metathoracic spiracles and is more stoutly built, with the mesosomal dorsum relatively wide. It occurs from Cooktown south to Mackay.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 10’)

MATERIAL. Annan R. Xing. 3km SE, 15°33’S, 145°14’E, 10.vi.1996 (RJK acc. 96.35) (w); Chewko Rd, 2-3km SW of Mareeba, 17°01’S, 145°24’E, 23-25.ii.2000 (RJK et al. acc.2000.48, 63) (w); 9th Mission Bch, 2km Nby W, 17°55’S, 146°05’E, 18-19.vii.1980 (RJK acc. 80.82) (w); Cardwell Ra., Murray R. Falls, 18°09’S, 145°49’E, 1-5.viii.1983 (RJK acc. 83.4); Mt Elliott NP, Alligator Ck, 19°26’S, 146°57’E, 11.vi.1987 (RJK acc. 87.95) (w).

REMARKS. This new species has more-or-less obtuse pronotal shoulders, resembling those of P. obtusa Emery from New Guinea and eastern Indonesia. However, it differs in several characters, including a more slender body, heavily sculptured pronotal dorsum and the propodeal and petiolar spines distinctly less divergent. It is known only from the Wet Tropics.

Polyrhachis (Chariomyrma) sp.  
(‘Chario 11’)

FIG. 2. Living workers of representative Wet Tropics Polyrhachis species. A, P. (Chariomyrma) schoopa; B, P. (Chariomyrma) sokolova; C, P. (Cyllomyrma) australis; D, P. (Hagiomyrma) thusnelda; E, P. (Hedomyrma) argeniosa; F, P. (Hedomyrma) turneri. (Photographs, Jeff Wright, QM)

REMARKS. A single specimen collected near Mareeba is the only record of this new species from the Wet Tropics. It is undoubtedly related to P. schoopa Forel, featuring similar, intricately carved, lateral margins of the mesosomal dorsum. However, besides other characters, it differs by its distinctly smaller size. It has also been collected at East Alligator R. in the Northern Territory and elsewhere in Queensland from Mackay south to Brisbane.

**Polyrhachis (Chariomyrma) sp.**

("Chario 13")

MATERIAL. Station Ck, upper, 16°37'S, 145°14'E, 370m, 3-11.i.1999 (GBM & DJC) (w); Barratt Ck, c. 4km ESE of Daintree, 16°16'S, 145°21'E, 21.vii.1980 (RJK acc. 80.101) (w); Porter Ck, 23km SE of Cardwell, 18°26'S, 146°08'E, 26.ii.2000 (RJK et al. acc. 2000.68) (w); Wallaman Falls, 18°35'S, 145°48'E, 28.ix.1987 (RJK acc. 87.100) (w); Mt Elliot NP, Alligator Ck, 19°26’S, 146°57’E, 2.x.1977 (RJK acc. 77.7) (w).
WET TROPICS POLYRHACHIS

REMARKS. This is yet another new species apparently related to *P. obtusa* Emery. It shares with that species (and with *P. 'Chario 10'*) the more-or-less obtusely spinose pronotal shoulders but it differs in having relatively wide mesonotal and propodeal dorsa and the propodeal spines distinctly broader at their bases. It is known only from the Wet Tropics.

Polyrhachis (Crytomyrma) yorkana
Forel, 1915
(Fig. 3B)
Polyrhachis (Crytomyrma) rastellata var. yorkana Forel, 1915: 110.

REMARKS. Polyrhachis yorkana is similar to P. debilis and the two were considered synonyms by Than (1978). Both share the peculiar variability in development of the propodeal spines. These may be sharp, upturned denticles, or present only as tubercules, or completely absent, even within a single colony. However, the species differs in a number of characters and, for the purpose of this paper, I consider P. yorkana distinct from P. debilis. The distribution of P. yorkana appears to be centred on the Wet Tropics, however, it has also been recorded from Wenlock R. on Cape York Pen. (P. Filewood).

Polyrhachis (Crytomyrma) sp.
(‘Cyrto 03’)

REMARKS. This is the most common Crytomyrma species north of Townsville where it virtually replaces P. australis. It extends from Cape York Pen. south to Mackay.

Polyrhachis (Crytomyrma) sp.
(‘Cyrto 04’)

MATERIAL. Caravonica, 10km NW of Cairns, 16°51′S, 145°41′E, 19.v.1996 (SKR #316, 317) (w.); Babinda, Double Barrel Ck, 25.i.1994 (C.J. Hill) (w., 2).

REMARKS. This species is intermediate between P. ‘Cyrto 05’, below, and the Indonesian P. rastellata goramensis Emery, originally described from Goram I. However, it differs from the former by its larger size and from both species in having the pronotal dorsum with only an indication of humeral angles. These, in P. ‘Cyrto 05’, are produced into distinct teeth while in P. rastellata goramensis the shoulders are evenly and widely rounded. P. ‘Cyrto 04’ also differs in having the lateral petiolar spines only slightly longer than the dorsal pair, while these are distinctly elongated in P. rastellata goramensis. The distribution of this species is apparently limited to the Wet Tropics.

Polyrhachis (Crytomyrma) sp.
(‘Cyrto 05’)

18.v.1998 (GBM) (w); Caravonica, 10km NW of Cairns, 16°51'S, 145°41'E, 2.iii.1996 (SKR #241, 316) (w, ♂, ♀); Lake Placid, 16°52'S, 145°40'E, 18.x.1995 (SKR #57) (w); Cairns, Botanic Gardens, 16°54'S, 145°45'E, 18.i.1997 (SKR #465, 490, 493) (w, ♀); Russell R., Bellenden Ker landing, 17°16'S, 145°56'E, 1-9.xi.1981 (GBM & Earthwatch Exp.) (w); Bellenden Ker, Cableway Base Stn, 17°16'S, 145°53'E, 8-23.iv.1987 (E.C. Dahms & G. Sames) (w); Babinda, Double Barrel Ck, 25.i.1994 (C.J. Hill) (w, ♂); Mission Bch, 17°52'S, 146°05'E, 10m, 5.vi.1996 (SKR #405) (w, ♂); Sth Mission Bch, 6km W, 17°56'S, 146°02'E, 5.vi.1996 (RJK) (w).

REMARKS. This species is characterised by its relatively highly arched mesosomal dorsum with a distinct depression at the propodeal suture, pronotal shoulders with well-defined teeth and a lack of propodeal spines. It is common from Cape York Pen. south to near Mission Beach.

**Polyrhachis (Cyrtomyrma) sp.**

(*Cyrtomyrma* 06)

MATERIAL. Parrot Ck, upper, 15°48'S, 145°16'E, 300m, 22.xi.1998 (GBM & Bouchard) (w); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04'S, 145°28'E, 1.i.1991 (R. Kitching) (w); Cape Tribulation, 16°04'S, 145°28'E, 9.v.1997 (SKR #550) (w); Noah Ck, S of Cape Tribulation, 16°08'S, 145°25'E, 13-19.x.1980 (GBM) (w); ditto, 25-28.vii.1993 (H. Mitchell) (w); Smithfield, Cairns, 16°50'S, 145°41'E, 5.v.1997 (SKR #553) (w); Bellenden Ker, Cableway Base Stn, 17°16'S, 145°53'E, 17-24.x.1981 (GBM & Earthwatch Exp.) (w); Mission Bch, 17°45'S, 146°00'E, 10m, 29.ii.1996 (SKR #256) (w, ♀, ♂); Kirrama Ra., c. 9km W of Kennedy, 18°12'S, 145°52'E, c. 110m, 4.vi.1996 (RJK et al. acc. 96.13, 14) (w); Hinchinbrook l., Gayundah Ck, <100m, 8-18.xi.1984 (GBM) (w); Paluma Ra., Little Crystal Ck, 29.ii.1996 (SKR #147) (w).

REMARKS. This species appears to be closely related to *P. seminervis* Donisthorpe from the Philippines and it shares with that species the parallel-sided pediotie with rudimentary spines. However they differ in other aspects and, because of the considerable distance separating their distributions, I prefer to consider them distinct rather than as distant populations of a single species. The known distribution of the Australian species extends from Cape York Pen., south to Hinchinbrook L., while *P. seminervis* is known only from the Philippines and northern Borneo.

**Polyrhachis (Cyrtomyrma) sp.**

(*Cyrtomyrma* 07)

MATERIAL. Davies Ck, 20km E of Mareeba, 17°02'S, 145°37'E, 15.vi.1980 (RJK acc. 80.19) (w).

REMARKS. The unusual colour scheme of this species sets it apart from all other Australian members of the subgenus *Cyrtomyrma*. The reddish-brown body and honey-yellow gaster and appendages are peculiar in a subgenus in which most species are uniformly black. The small series from Davies Ck., collected by sweeping low vegetation along the rainforest edge, are the only known specimens.

**Polyrhachis (Cyrtomyrma) sp.**

(*Cyrtomyrma* 08)

MATERIAL. Canopy Crane site, Cape Tribulation, 16°06'S, 145°27'E, 8.x.1999 (N. Bluthgen #1002) (w); Black Mtn Rd, nr Kuranda, 16°47'S, 145°38'E, 21.vii.1980 (RJK acc. 80.103) (w); Davies Ck, 17km E of Mareeba, 17°01'S, 145°35'E, 15.vi.1980 (RJK acc. 80.20) (w); Palmerston NP, 17°37'S, 145°48'E, 350-400m, 2.i.1990 (GBM) (w); Mission Bch, 17°45'S, 146°00'E, 10m, 29.ii.1996 (SKR #253) (w, ♀); Upper Boulder Ck, 8km N of Tully, 17°49'S, 145°54'E, 100-500m, 4.xii.1989 (GBM, GT & HJ) (w).

REMARKS. This species closely resembles *P. yokana*, however its considerably smaller size and rather well developed, although short, propodeal spines, set it well apart. It appears restricted to the Wet Tropics.

**Polyrhachis (Cyrtomyrma) sp.**

(*Cyrtomyrma* 09)

MATERIAL. Kirrama Ra., c. 9km W of Kennedy, 18°12'S, 145°52'E, c. 110m, 4.vi.1996 (RJK et al. acc. 96.13) (w).

REMARKS. With a strongly transverse pronotal dorsum, featuring clearly bilobed shoulders, and well developed propodeal spines, this species stands relatively close to *P. levior* Roger, 1863 (= *laevissima* Fr. Smith, 1859) from Aru Islands. I consider it to be intermediate between that species and *P. australis* Mayr. The only known specimens were collected on a single occasion by sweeping and beating low rainforest foliage and other vegetation.

**Subgenus Hagiomyrma** Wheeler, 1911

**Polyrhachis (Hagiomyrma) ammon**

(Fabricius, 1775)

*Formica ammon* Fabricius, 1775: 394.

*Polyrhachis ammon* (Fabricius); Fr. Smith, 1858: 73.

MATERIAL. Hann Tbld, (Nth End), 16°48'S, 145°10'E, 950-1000m, 11-14.xii.1995 (GBM, GT & DJC) (w); Davies Ck NP, 17°31'S, 145°35'E, 7.vi.1996 (RJK & CJB); Mill Ck, above, 18°32'S, 146°11'E, 1000m, 5.i.1999 (GBM & DJC) (w); Kirrama Ra., 18°10'S, 145°44'E, c. 600m, 26.vii.1987 (RJK acc. 87.97) (w); Mt Stuart summit, Townsville, c. 580m, 20.xi.1980 (BBL) (w).
REMARKS. *Polyrhachis ammon* is a widespread, common species along the eastern Australian seaboard. It ranges from north Queensland south to Victoria, however, it becomes rather uncommon towards the northern limits of its distribution. All localities within the Wet Tropics are at higher elevations.

**Polyrhachis (Hagiomyrma) crawleyi**
Forel, 1916

*Polyrhachis (Hagiomyrma) ammonoeides var. crawleyi*

**Polyrhachis (Hagiomyrma) lachesis**

Polyrhachis (Hagiomyrma) trapezoidea
Mayr, 1876

Polyrhachis trapezoidea Mayr, 1876: 72.

MATERIAL. 3km SE of Annan R. Xing, 15°33'S, 145°14'E, 10.vi.1996 (RJK acc. 96.35) (w); Black Mtn, NW base, 15°40'S, 145°13'E, 10.vi.1996 (CJB) (w); Bakers Blue Mtn, 17km W of Mount Molloy, 12.ix.1981 (GBM & DJC) (w); Chekwo Rd, 2-3km SW of Mareeba, 17°01'S, 145°24'E, 23-25.i.2000 (RJK et al. acc. 2000.51) (w); Mt Elliot NP, Alligator Ck, 19°26'S, 146°57'E, 2.ix.1977 (RJK acc. 77.5) (w).

REMARKS. Polyrhachis trapezoidea ranges from Torres Strait south to Rockhampton and also occurs in the Northern Territory. It is common in savannah woodlands and open forests.

Polyrhachis (Hagiomyrma) tubifera Forel, 1902

Polyrhachis tubifera Forel, 1902: 517.

MATERIAL. Home Rule, 15°45'S, 145°17'E, c. 200m, 9-11.vi.1996 (RJK acc. 96.43) (w); Barratt Ck, 4km ESE of Daintree, 16°16'S, 145°21'E, 21.vii.1980 (RJK acc. 80.100) (w); 10km NW of Ellis Bch, 16°40'S, 145°34'E, 8.vi.1996 (RJK et al. acc. 96.33) (w); 1km NW of Buchanan Point, 16°44'S, 145°39'E, 3-11.ji.1999 (GBM & DJC) (w); Hann Tbl, (Nth End), 16°48'S, 145°10'E, 11-14.xi.1995, 950-1000m (GBM, GT & DJC) (w, ♂, ♀); Chekwo Rd, 2-3km SW of Mareebas, 17°01'S, 145°24'E, 23-25.i.2000 (RJK et al. accs 2000.46) (w); Davies Ck NP, 17°31'S, 145°35'E, 7.vi.1996 (RJK & CJB); Kerrama Ra., nr JCU Field Stn, c. 600m, 18°11'S, 145°44'E, 4.vi.1996 (RJK acc. 96.15) (w); Porter Ck, 23km SE of Cardwell, 18°26'S, 146°08'E, 26.i.2000 (RJK et al. acc. 2000.66) (w); Hinchinbrook l., v.1998 (A.D. Cutter) (w); Wallaman Falls, 18°35'S, 145°48'E, 28.x.1997 (RJK acc. 87.99) (w); Mt Elliot NP, Alligator Ck, 19°26'S, 146°57'E, 11.vi.1987 (RJK acc. 87.89) (w).

REMARKS. Polyrhachis tubifera occurs commonly from Iron Ra. on Cape York Pen. south to Cooloola NP north of Brisbane.

Polyrhachis (Hagiomyrma) sp. ('Hagio 03')

MATERIAL. Townsville, 12.xi.1901 (W.W. Froggatt) (w); Townsville, 25.x.1919 (G.F. Hill #1119) (w); Major Ck, 22km SW of Ginu, 25.x.1980 (BBL) (w, ♂).

REMARKS. This species was evidently regarded by Forel as P. ammonoides Roger. Specimens collected by E. Mjöberg at Laura on Cape York Pen. are lodged in MHNG, MNHU and NRMS and bear Forel’s identification labels ‘Polyrhachis ammonoides Roger’. It ranges from Laura on Cape York Pen. south to Mackay. (A short series of alate ♀ were recently collected at light at Virgina, near Darwin, Northern Territory (B. Hoffman).

Polyrhachis (Hagiomyrma) sp. ('Hagio 04')

MATERIAL. Mt Fernigan, summit, 1100m, 19-21.iv.1982 (GBM) (w); ditto, 28-30.xi.1985 (GBM, DJC & L. Roberts) (♀); Thornton Peak, 16°10'S, 145°23'E, 1374m, viii.1984 (GBM) (w); Mt Bartle Frere, 5th Peak, 17°24'S, 145°49'E, 8.xi.1981 (GBM & Earthwatch Exp.) (w); Koomboolooma T'ship, 2.5km WSW, 17°50'S, 145°34'E, 740m, 4.i.-15.iv.1999 (GBM & S.R. Monteith) (w); Cardwell Ra., Macalister Mts, 18°18'S, 145°55'E, 800-900m, 13-16.i.1987 (S. Hamlet) (w); Cardwell Ra., Upper Broadwater Ck, 17-21.xii.1986 (GBM, GT & S. Hamlet) (w).

REMARKS. This new species is restricted to high elevations including the 1600m summit of Mt Bartle Frere. It is relatively close to P. penelope, originally described from Mackay, but differs in a number of characters. I am confident that it represents a distinct species. It is endemic to the Wet Tropics.

Polyrhachis (Hagiomyrma) sp. ('Hagio 10')

MATERIAL. Black Mtn, NW base, 15°40'S, 145°13'E, 10.vi.1996 (CJB) (w); Home Rule, 15°45'S, 145°17'E, c. 200m, 9-11.vi.1996 (RJK acc. 96.43) (w); Mt Hartley, 15°46'S, 145°19'E, 200-500m, 11.vi.1996 (CJB) (w); Ellis Bch, 10km NW, 16°40'S, 145°34'E, 8.xi.1996 (RJK et al. acc. 96.33) (w); St Mission Bch, 6km W, 17°56'S, 146°02'E, 18-19.viii.1980 (RJK acc. 80.62) (w); Porter Ck, 23km SE of Cardwell, 18°26'S, 146°08'E, 26.i.2000 (RJK et al. acc. 2000.66) (w); Hinchinbrook l., v.1998 (A.D. Cutter) (w).

REMARKS. This species ranges from Iron Ra. on Cape York Pen. south to about Ingham. It is a common species in low altitude open forests.

Polyrhachis (Hagiomyrma) sp. ('Hagio 11')

MATERIAL. Davies Ck, 15km E of Mareeba, 17°00'S, 145°34'E, 15.vi.1980 (RJK acc. 80.25) (w); 1km E of Mingela, 19°53'S, 146°38'E, 5.i.1977 (BBL) (w).

REMARKS. This widespread species ranges from the Kimberley region of North Western Australia and Northern Territory to northern Queensland where it occurs from Cape York Pen. south to Rundle Ra. near Gladstone. It is another close relative of P. penelope Forel (see P. 'Hagio 04' above). It is relatively common in open woodlands.
**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 14’)

MATERIAL. Davies Ck, 3km of Kennedy Hwy, nr Mareeba, 3.viii.1975 (BBL) (w).

REMARKS. A small series of workers collected by B.B. Lowery at Davies Ck are the only known specimens of this species. It is closely related to *P. penelope* Forel and particularly to *P. denticulata* Karavaieff from New Guinea, which was only recently reported from Mabuiaq I. in Torres Strait (Kohout & Taylor, 1990:541). The collection locality is open forest.

**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 16’)

MATERIAL. Paluma, 18km W, 3.iii.1980 (BBL) (w); Hervey Ra., Turtle Rock area, 19°24’S, 146°31’E, c. 500m, 3.vi.1996 (RJK et al. accs 96.10, 11) (w).

REMARKS. The distribution of this new species extends from Paluma Ra. south to Rockhampton and westwards to Carnarvon Gorge.

**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 17’)

REMARKS. This species is close to *P. lydiae* from Mackay, however its structural characters and colour clearly show it to be distinct. It inhabits a wide variety of habitats, from the savannah woodlands on the western slopes of Atherton Tbld, to coastal *Melaleuca* swamps. It is apparently endemic to the Wet Tropics.

**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 18’)

REMARKS. A rare species which is known from three, widely separated populations, the northern on Windsor Tbld and the two southern ones on Blackdown Tbld and Mt Moffat NP. All are high altitude, open forest localities.

**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 20’)

MATERIAL. Hann Tbld (Nth End), 16°48’S, 145°10’E, 950-1000m, 11-14.xii.1995 (GBM, GT & DJC) (w, ?); Paluma, 12km W, 3.ii.1980 (BBL) (w).

REMARKS. This species is related to *P. ammon* (Fabricius). However, the relatively small, quadrate, pronotal dorsum and its dense pubescence and pilosity clearly distinguish it. It is known only from two separate populations within the Wet Tropics.

**Polyrhachis (Hagiomyrma) sp.**  
(‘Hagio 21’)

MATERIAL. Paluma, 18km W, c. 800m, 23.iii.1981 (BBL) (w); Mt Elliot NP, North Ck, 500-800m, 2.xii.1986 (GBM, GT & S. Hamlet) (w); Mt Elliot, N ridge, 19°29’S, 146°58’E, 790m, 5.vii.1977 (RWT acc. 77.240) (w).

REMARKS. In general appearance this species is very similar to *P. trapezoidea* Mayr, however the petiole lacks the characteristic sloping dorsum of the latter species. Specimens from Paluma differ slightly from those from Mt Elliot, but I am confident they only represent a different population of a single species. It is evidently endemic to the Wet Tropics.

Subgenus *Hedomyrma* Forel, 1915

**Polyrhachis (Hedomyrma) argentosa** Forel, 1902  
(Fig. 2E)

MATERIAL. Mt Hartley, 15°46’S, 145°19’E, 500-700m, 11.vi.1996 (CJB) (w); Mt Lewis, Upper Leichhardt Ck, 16°35’S, 145°16’E, 840m, 18.xi.1997 (GBM) (w); Kuranda, 16°50’S, 145°37’E, 5.iii.1992 (H. Reichel) (w); Whitlefield Ra., 16°57’S, 145°42’E, 500m, 26.vii.1991 (GBM & HJ) (w); Davies Ck, 17km E of Mareeba, 17°21’S, 145°35’E, 15.vi.1980 (RJK acc. 80.21) (w); Bellenden Ker, Cableway Base Stn, 17°16’S, 145°33’E, 17-24.x.1981 (GBM & Earthwatch Exp.) (w); Etty Bay, 7km ESE of Innisfail, 17°35’S, 146°05’E, 23.vii.1980 (RJK acc. 80.157) (w); Palmerston NP, Crawford Lookout, 17°38’S, 145°49’E, 23.vii.1980 (RJK acc. 80.154) (w); Forty Mile Scrub NP, 18°05’S, 144°53’E, 25.vii.1996 (JPH) (w); Kirrama Ra., 18°11’S, 145°52’E, 19.ii.2000 (RJK acc. 2000.4) (w); Seaview Ra., Mt Fox Crater, 18°51’S, 145°48’E, 15.xii.1986 (GBM, GT & S. Hamlet) (w); Paluma Ra., Little Crystal Ck, 29.i.1996 (SKR #144) (w); Mt Elliot NP, North Ck, 500-800m, 2.xii.1986 (GBM, GT & S. Hamlet) (w).

REMARKS. This species extends from south of Cooktown to Rundle Ra. near Gladstone. It inhabits rainforests and wet sclerophyll forests, but has also been collected from higher altitude open forests. Like most *Hedomyrma* it is a lignicolous species nesting mostly in hollow twigs and small branches.
**Polyrhachis (Hedomyrma) barretti**
Clark, 1928

*Polyrhachis (Hedomyrma) barretti* Clark, 1928: 170.

**MATERIAL.** Mt Hedley, 1-2km N of Home Rule, 15°45′S, 145°17′E, 200-300m, 11.vi.1996 (RJK et al. acc. 96.44) (w); Mt Hartley, 15°46′S, 145°19′E, 500-700m, 11.vi.1996 (CJB) (w); Oliver Creek, c. 8km SW of Cape Tribulation, 16°08′S, 145°26′E, 14.vi.1996 (RJK acc. 96.53) (w); Barratt Creek, 4km ESE of Daintree, 16°16′S, 145°21′E, 21.vii.1980 (RJK acc. 80.99) (w); Port Douglas, viii.1928 (C.L. Barrett) (barretti, syntype w VMMA); Ellis Beach, 10km NW, 16°40′S, 145°34′E, 8.vi.1996 (RJK et al. acc. 96.33) (w); Black Mtn Rd, 4km N of Kuranda, 16°47′S, 145°38′E, 21.vii.1980 (RJK acc. 80.108) (♀); Yarrabah, c. 9km E of Cairns, 16°54′S, 145°51′E, 22-24.vii.1980 (RJK acc. 80.116) (w); 'The Boulders', 6km W of Babinda, 17°21′S, 145°52′E, 20.vii.1980 (RJK acc. 80.98) (w); Mission Beach, 2km W, 17°52′S, 146°05′E, 18-19.vii.1980 (RJK acc. 80.86, 92) (w); Sth Mission Beach, 6-10km W, 17°56′S, 146°02′E, 18-19.vii.1980 (RJK acc. 80.61) (w); Porte Creek, 23km SE of Cardwell, 18°26′S, 146°08′E, 26.vi.2000 (RJK et al. acc. 2000.4) (♀).

**REMARKS.** *Polyrhachis barretti* is known from Cape York Pen. south to Mission Beach. It is common in suitable localities along edges of lowland rainforest.

**Polyrhachis (Hedomyrma) cleopatra**
Forel, 1902

*Polyrhachis cleopatra* Forel, 1902: 513.

**MATERIAL.** Kurrara Ra., 18°11′S, 145°44′E, 29.vii.1996 (SKR #155) (w); Hervey Ra., Turtle Rock area, 19°24′S, 146°31′E, 24.viii.1995 (SKR #17) (w); Mt Elliot NP, St Margaret Creek, 19°29′S, 147°01′E, 23.vi.1995 (SKR #9) (w).

**REMARKS.** *Polyrhachis cleopatra* is relatively uncommon and many past records from the Wet Tropics are, in fact, referable to a new species (*P. Hedo 13* below). Both are predominantly forest species, but have also been recorded from wet sclerophyll and open forest localities. *P. cleopatra* appears to be centred on the greater Mackay area, including the Whitsundays, with only a few confirmed records from the southern limits of the Wet Tropics area.

**Polyrhachis (Hedomyrma) cloio**
Forel, 1902

*Polyrhachis cloio* Forel, 1902: 515.

**MATERIAL.** Hann Tbl (Nth End), 16°49′S, 145°11′E, 1000m, 13.xii.1995 (GBM, GT & DJC) (w); Atherton Tbl, Yungaburra region, Tolga Scrub, iv.1996 (A. Cutter & J. King) (w); Bellenden Ker, Cableway Base Ssn, 17°16′S, 145°54′E, 17-24. ix.1981 (GBM & Earthwatch Exp.) (w); Etty Bay, 7km ESE of Innisfail, 17°33′S, 146°05′E, 23. vii.1980 (RJK acc. 80.157) (w).

**REMARKS.** This is a rainforest species favouring areas along the edges of lowland rainforest. It is known from Iron R, on Cape York Pen. south to Brunswick Heads in northern New South Wales, and from the Northern Territory.

**Polyrhachis (Hedomyrma) clotho**
Forel, 1902

*Polyrhachis clotho* Forel, 1902: 525.

**MATERIAL.** Mt Elliot NP, Alligator Creek, 19°26′S, 146°57′E, 2. ix.1977 (RJK acc. 77.6) (w).

**REMARKS.** *Polyrhachis clotho* ranges from Lakefield NP on Cape York Pen. south to Mackay. It inhabits cool temperate open forests and woodlands.

**Polyrhachis (Hedomyrma) cupreata**
Emery, 1895

(Fig. 4E)

*Polyrhachis hermione var. cupreata* Emery, 1895: 357.

**MATERIAL.** Mt Hedley, 1-2km N of Home Rule, 15°45′S, 145°17′E, 200-300m, 11.vi.1996 (RJK et al. acc. 96.44) (w); Home Rule, 15°45′S, 145°17′E, c. 200m, 9-11.vi.1996 (RJK et al. acc. 96.43) (♀); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04′S, 145°26′E, 12-15.vi.1996 (RJK et al. acc. 96.47) (w); Canopy Crane site, Cape Tribulation, 16°06′S, 145°27′E, 20-21.vii.2000 (RJK acc. 2000.19) (w); Ellis Beach, 10km NW, 16°40′S, 145°34′E, 8.vi.1996 (RJK et al. acc. 96.33) (w); Trinity Beach, 17km NNW of Cairns, 16°47′S, 145°41′E, 13.v.1974 (RJK acc. 74.30) (♀); Cairns (M. Podenzana) (*cupreata* holotype w MCSI); Yarrabah (E. Mjöberg) (*daemeli exlex* holotype w NRMS); Yarrabah, c. 9km E of Cairns, 16°54′S, 145°51′E, 22-24.vii.1980 (RJK acc. 80.115) (w); Whitley Fire Environ. Park, 16°57′S, 145°42′E, 4.i.1992 (H. Reichel) (w); Pine Creek CSIRO Tower, Yarrabah Rd, 16°59′S, 145°50′E, 12.iv.1991 (GBM & HJ) (w); Bell Peak North, 20km S of Cairns, 17°05′S, 145°53′E, 16.ix.1981 (GBM & DJC) (w); Russell R., Bellenden Ker Landing, 17°16′S, 145°56′E, 1-9.xi.1981 (GBM & Earthwatch Exp.) (w); Mission Beach, c. 2km W, 17°52′S, 146°05′E, 18-19.vii.1980 (RJK acc. 80.94) (w); Cardwell Ra., Murray R. Falls, 18°09′S, 145°49′E, 1-5.viii.1983 (RJK acc. 83.2) (w).

**REMARKS.** This species ranges from Torres Strait south to about Ingham, with additional records from the Northern Territory. It is common in coastal wetlands and *Melaleuca* swamps, but it has also been collected from the canopy of lowland tropical rainforest.
Polyrhachis (Hedomyrma) daemeli
Mayr, 1876

Polyrhachis daemeli Mayr, 1876: 72.

MATERIAL. Hann Tbld Radar Stn, 16°55'S, 145°15'E, 950m, 26-27.xi.1998 (GBM) (w); Trinity Bch, 17km NNW of Cairns, 16°47'S, 145°41'E, 13.v.1974 (RJK acc. 74.27) (w); Walsh R. at Watsonville, 17°21'S, 145°19'E, 750m, 1.xii.1997 (GBM, DJC & CJB) (w); Cardwell R., Murray R. Falls, 18°09'S, 145°49'E, 1-5.viii.1983 (RJK acc. 83.3) (w); Paluma R., Hidden Valley, ix.1997 (B. Hoffman) (w).

REMARKS. This is a common species between Mackay and Brisbane, however records become somewhat sporadic towards the northern limits of its distribution.
Polyrhachis (Hedomyrma) erato Forel, 1902

Polyrhachis erato Forel, 1902: 512.

MATERIAL. Atherton Tbld. N of Lake Tinaroo, c. 2500ft, 9.xi.1966 (RWT acc. 66.334) (w); Bartle Frere, S Peak summit, 17°24'S, 145°49'E, 1620m, 29.xi.1998 (GBM) (♀); Cedar Ck. (E. Mjoberg) (aescyle holotype w NRMS).

REMARKS. Besides the holotype of *P. aescyle* only a short series of this species from Lake Tinaroo and a single dealate queen from the summit of South Peak of Bartle Frere are known from the Wet Tropics. Like the previous species, it is much more common and widespread in the south, from Mackay to Lamington NP on the Queensland-New South Wales border.

Polyrhachis (Hedomyrma) euterpe Forel, 1902

Polyrhachis euterpe Forel, 1902: 511.

REMARKS. This is a rare species with a patchy distribution from northern to southern Queensland. It occupies savannah woodlands and open forests along the eastern slopes of the Great Dividing Range.

Polyrhachis (Hedomyrma) hermione Emery, 1895

Polyrhachis hermione Emery, 1895: 357. (For full synonymy citations see Kohout, 1998: 514.)

MATERIAL. Kuranda, vi.1904 (F.P. Dodd) (w); Bellenden Ker (M. Podenzana) (hermione syntype w MCSN, MHNG); Kirrama Ra., c. 9km W of Kennedy, 18°12'S, 145°52'E, 29.ii.1996 (SKR #153) (w); Hinchinbrook I., Gayundah Ck, 18°21'S, 146°14'E, 100-500m, 9.xi.1984 (GBM) (w).

REMARKS. *Polyrhachis hermione* is a rare rainforest species only known from a few isolated collections within the Wet Tropics.

Polyrhachis (Hedomyrma) machaon Santschi, 1920

Polyrhachis (Hedomyrma) machaon Santschi, 1920: 568.

MATERIAL. Townsville, vi.1902 (F.P. Dodd) (machaon holotype w NHMB).

REMARKS. The unique holotype of *P. machaon* is the only specimen known from the Wet Tropics. All recently collected specimens originate from central and southern Queensland and northern New South Wales with the species apparently restricted to mangroves (De Baar & Hockey, 1987: 20).

Polyrhachis (Hedomyrma) mjobergi Forel, 1915

MATERIAL. Kirrama Ra., nr JCU Field Stn, c. 600m, 18°11'S, 145°44'E, 4.vi.1996 (RJK acc. et al. 96.15) (w).

REMARKS. This is the only record of *P. mjobergi* from the Wet Tropics and considerably extends its known range. It was originally described from Lamington NP in southern Queensland and from Trial Bay (anguliceps Viehmeyer) in northern New South Wales. Its main distribution range extends from near Mackay south to Batemans Bay.

Polyrhachis (Hedomyrma) ornata Mayr, 1876

MATERIAL. Windsor Tbld, SE, 16°16'S, 145°05'E, 850m 9.i.-17.v.1998 (GBM & DJC) (w).

REMARKS. A single specimen from Windsor Tbld significantly extends the range of this species. In the northern specimen the characteristic bright copper or brassy pubescence of the mesosomal dorsum is considerably less distinct, but in all other aspects it matches the abundant material of *P. ornata* from southern Queensland.

Polyrhachis (Hedomyrma) rufisemur Forel, 1907

MATERIAL. Mt Spurgeon, 3km S, 16°27'S, 145°11'E, 19-23.xi.1997 (GBM, CJB & DJC) (w); Hann Tbld (Nth End), 16°49'S, 145°11'E, 1000m, 11-14.xii.1995 (GBM, GT & DJC) (w); Hann Tbld Radar S, 16°55'S, 145°15'E, 950m, 26-27.xi.1998 (GBM, P. Bouchard & A. O'Toole) (w); Bakers Blue Mtn, 17km W of Mount Molloy, 16°42'S, 145°09'E, 12.x.1981 (GBM & DJC) (w); Kuranda, nr Cairns (R. Turner) (terpsichore elegans syntype w MHNG); Millstream Coral-auk, 17°32'S, 145°29'E, 1040m, 6.xii.1998-4 ii.1999 (GBM & DJC) (w).

REMARKS. As indicated earlier (Kohout, 1988b: 436), specimens of the northern
populations (terpsichore elegans) tend to be larger with less distinct and more diluted pubescence than specimens from southeast Queensland and New South Wales.

**Polyrhachis (Hedomyrma) thais** Forel, 1910

**Polyrhachis thais** Forel, 1910: 86.

**Material.** Kuranda, nr Cairns (R. Turner) (thais syntype w MHNG); Mission Beh, 17°52’S, 146°06’E, 29.i.1996 (SKR #226, 227) (w); 5th Mission Beh, 2km Nby W, 17°53’S, 146°05’E, 18-19.vii.1980 (RJK acc. 80.80) (w); Kirrama Ra., 18°11’S, 145°52’E, 19.ii.2000 (RJK acc. 2000.4) (w); Wallaman Falls, 18°35’S, 145°48’E, 28.ix.1987 (RJK acc. 87.101) (w); Crystal Creek NP, 18°59’S, 146°09’E, 330m, 11.i.1977 (BBL) (w, ?); Mt Elliot NP, North Ck, 500-800m, 2.xii.1986 (GBM, GT & S. Hamlet) (w).

**Remarks.** This is a relatively rare rainforest species apparently endemic to the Wet Tropics.

**Polyrhachis (Hedomyrma) turneri**

Forel, 1895

(Figs 2F, 3D)

**Polyrhachis turneri** Forel, 1895: 45.

**Material.** Black Mtn, NW base, 15°40’S, 145°13’E, 10.v.1996 (CJB) (w); Hann Tbid (Nth Base), 16°48’S, 145°12’E, 500m, 11-14.xii.1995 (GBM, GT & DJC) (w); Yarrabah, c. 9km E of Cairns, 16°54’S, 145°51’E, 22-24.vii.1980 (RJK acc. 80.115) (w); Bakers Blue Mtn, 17km W of Mount Molloy, 16°42’S, 145°09’E, 12.ix.1981 (GBM & DJC) (w); Wallaman Falls, 18°35’S, 145°48’E, 28.ix.1987 (RJK acc. 87.102) (w); Paluma Ra., Hidden Valley, xi.1997 (B. Hoffman) (w); Mt Stuart, Townsville, 19°21’S, 146°47’E, 12.iii.1993 (GBM) (w); Hervey Ra., Turtle Rock area, 19°24’S, 146°31’E, 24.ix.1995 (SKR #16) (w); Mt Elliot NP, Alligator Ck, 19°26’S, 146°57’E, 11.vii.1987 (RJK acc. 87.90) (w).

**Remarks.** *Polyrhachis turneri* is known from Torres Strait south to Mackay. It selects rock crevices in which to build its nests which are characterised by pure white, tubular, silky entrances.

**Polyrhachis (Hedomyrma) sp.**

(‘Hedo 05’)

**Material.** Mt Cook NP, 15°29’S, 145°16’E, 430m, 9.xi.1995 (GBM, DJC & HJ) (w); Mt Hartley, 15°46’S, 145°19’E, 500-700m, 11.vi.1996 (CJB) (w); Cape Tribulation, 16°05’S, 145°28’E, 29.xii.1983-84,1984 (GBM) (w); Oliver Ck, c. 8km SW of Cape Tribulation, 16°08’S, 145°26’E, 14.vi.1996 (RJK acc. 96.53) (w); Kuranda, 16°49’S, 145°38’E, 10-20.vii.1976 (P. Filewood) (w); Yarrabah, c. 9km E of Cairns, 16°54’S, 145°51’E, 22-24.vii.1980 (RJK acc. 80.115) (w); Bellenden Ker, Cableway Base Stn, 17°16’S, 145°45’E, 17-24.x.1981 (GBM & Earthwatch Exp.) (w); Josephine Falls, 17°26’S, 145°51’E, 12.ii.1996 (GBM) (w); Eubenangee Swamp, nr Innisfail, 17°27’S, 145°58’E, <1000ft, 4.xi.1966 (RWT acc. 66.257) (w); Palmerston NP, 350-400m, 2.1.1990 (GBM) (w); 5th Mission Beh, 2km Nby W, 17°55’S, 146°05’E, 18-19.vii.1980 (RJK acc. 80.80).

**Remarks.** This species superficially resembles *P. thais* Forel but differs in a number of characters, including distinctly longer pronotal spines that in *P. thais* are reduced to more-or-less pointed angles. The distribution of both species is apparently limited to the Wet Tropics.

**Polyrhachis (Hedomyrma) sp.**

(‘Hedo 09’)

**Material.** Mt Elliot NP, North Ck, 500-800m, 2.xii.1986 (GBM, GT & S. Hamlet) (w, ?); Mt Elliot NP, St Margaret Ck, 19°30’S, 146°59’E, 23.ix.1995 (SKR #8) (w).

**Remarks.** This spectacular species appears to be restricted to Mt Elliot NP.

**Polyrhachis (Hedomyrma) sp.**

(‘Hedo 13’)

**Material.** Mt Hartley, 15°46’S, 145°19’E, 200-500m, 11.vi.1996 (CJB) (w); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04’S, 145°26’E, 12-15.vi.1996 (RJK et al. acc. 96.47) (w); Cape Tribulation, 16°05’S, 145°28’E, 19.x.1980 (GBM) (w); Hann Tbid, 16°55’S, 145°15’E, 950m, 26-27.xi.1998 (GBM) (w); Daintree, 4mi S, 29.x.1996 (RWT acc. 66.122) (w); Caravonica, 10km NW of Cairns, 16°51’S, 145°41’E, 19.ii.2000 (RJK acc. 2000.8) (w); Etty Bay, 7km ESE of Innisfail, 17°3’S, 146°05’E, 23.vii.1980 (RJK acc. 80.157) (w); Mission Beh, 2km W, 17°52’S, 145°05’E, 18-19.vii.1980 (RJK acc. 80.93) (w); Kirrama Ra., 18°11’S, 145°52’E, 19.ii.2000 (RJK acc. 2000.4) (w).

**Remarks.** This species resembles *P. cleopatra*, but differs in a number of characters. These include the first gastral tergite which is smooth and shining with only a weak indication of a lateral process. In *P. cleopatra* the first gastral...
tergite is intensively longitudinally sculptured with a very distinct lateral process. This is predominantly a rainforest species and appears endemic to the Wet Tropics.

**Subgenus Myrma** Billberg, 1820

**Polyrhachis reulebens** species-group

**Polyrhachis (Myrma) foreli** Kohout, 1989

(Fig. 4F)

‘*Polyrhachis (Myrma) reulebens r. andromeda var. andromeda*’ Forel, 1915: 110.

‘*Polyrhachis (Myrma) reulebens andromache andromeda*’ Forel; Taylor, 1986: 34. Unavailable name.

**REMARKS.** This species ranges from New Guinea south through Cape York Pen. to the Wet Tropics. It is a rainforest species commonly nesting in rotting logs or in the ground (Kohout, 1989: 510; 1998: 521).

**Subgenus Myrmhophla** Forel, 1915

**Polyrhachis (Myrmhophla) divers** species-group

**Polyrhachis (Myrmhophla) lombokensis** Emery, 1898

(Fig. 4H)

*Polyrhachis lombokensis* Emery, 1898: 239.

*Polyrhachis (Myrmhophla) lombokensis var. yarrabahenis* Forel, 1915: 115.

**MATERIAL.** Home Rule, 15°45’S, 145°17’E, c. 200m, 9-11.vi.1996 (RJK et al. accs 96.41, 49, 50) (♀, ♂); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04’S, 145°28’E, 12-15.vi.1996 (RJK et al. acc. 96.50) (♀, ♂); Canopy Crane site, Cape Tribulation, 16°06’S, 145°27’E, 20-21.ii.2000 (RJK acc. 2000.37) (♀, ♂); Kamerunga, 10km NW of Cairns, 16°53’S, 145°41’E, 13.vii.1960 (G.W. Saunders) (♀); Yarrabah (E. Mjöberg) (*yarrabahensis* syntype w MHNG, NRMS); Yarrabah, c. 11km E of Cairns, 16°56’S, 145°52’E, 22-24.vii.1980 (RJK accs 80.125, 126, 127, 133, 135, 136, 137, 144, 145, 148, 151) (♀, ♂); Seymour Ra., c. 7km N of Innisfail, 17°28’S, 146°01’E, <100m, 5-6.vi.1996 (RJK et al. acc. 96.24) (♀); Canal Ck, nr Innisfail, 23.v.1993 (L.R. Ring) (♀).

**REMARKS.** When Kohout & Taylor (1990) raised *P. (Myrmhophla) lombokensis yarrabahensis* to specific status they noted that the characters separating both taxa were relatively slight, but seemingly constant. They were hesitant to synonymize both names because of the great distance separating their respective distribution ranges with no material known to them from the intermediate areas. However, after examining the remaining specimens of Emery’s syntype series, which has thus only recently become available, I now regard both forms synonymous. The characters listed by Kohout & Taylor seem to integrate and I have no hesitation in considering *P. yarrabahensis* and *P. lombokensis* isolated populations of a single biological species. The distribution of this species in Australia is centred on the Wet Tropics, with only a single additional record from Massey Spur Ck on Cape York Pen. (J.L. Wassell). Its occurrence in Papua New Guinea has also been recently confirmed by discovery of a single series collected on Misima I. (Rev. H.K. Bartlett).

**Subgenus Myrmhophla** Forel, 1915

**Polyrhachis divers** species-group

**Polyrhachis (Myrmhophla) divers**

Fr. Smith, 1857

(Figs 3E, 4G)

*Polyrhachis divers* Fr. Smith, 1857: 64.

(For full synonymy citations see Bolton, 1995: 347).

Polyrhachis mucronata species-group
Polyrhachis (Myrmhopla) mucronata
Fr. Smith, 1859
(Fig. 3F)

Polyrhachis mucronatus Fr. Smith, 1859: 140.

MATERIAL. Mt Hedley, 1-2km N of Home Rule, 15°45'S, 145°17'E, 200-300m, 11.vi.1996 (RJK et al. acc. 96.44) (w); Cedar Bay NP, 15°48'S, 145°19'E, 16.vi.1997 (SKR #589) (w); Pilgrim Sands, c. 1km NW of Cape Tribulation, 16°04'S, 145°28'E, 12-15.vi.1996 (RJK et al. acc. 96.47) (w); Cape Tribulation NP, 16°04'S, 145°27'E, 6.xii.1985 (RJK acc. 85.5) (w, ♂); Canopy Crane site, Cape Tribulation, 16°06'S, 145°27'E, 20-21.i.2000 (RJK accs 2000.17, 21) (w, ♂); McLean Ck, c. 19km Sby'S of Cape Tribulation, 16°15'S, 145°26'E, 15.vi.1996 (RJK acc. 96.54) (w); Bellenden Ker, Cableway Base Stn, 17°16'S, 145°54'E, 17-24.x.1981 (GBM & Earthwatch Exp.) (w); Russell R., Bellenden Ker Landing, 17°16'S, 145°56'E, 1-9.xi.1981 (GBM & Earthwatch Exp.) (w); Josephine Falls, 17°26'S, 145°51'E, 12.ii.1996 (GBM) (w); Seymour Ra., c. 7km N of Innisfail, 17°28'S, 146°01'E, <100m, 5-6.vi.1996 (RJK et al. acc. 96.31) (w, ♂); Mission Bch, 17°45'S, 146°00'E, 10m, 20.i.1996 (SKR #101) (w); Dunk I., 17°57'S, 146°09'E, viii.1927 (H. Hacker) (♂); Hinchinbrook I., Gayundah Ck, 18°21'S, 146°14'E, 100-500m, 8-18.xi 1984 (GBM) (w).

REMARKS. Polyrhachis mucronata ranges from eastern Indonesia and New Guinea south to northern Queensland. The specimens from Australia and New Guinea differ somewhat from the holotype and other available material from Indonesia, however, for the purpose of this paper I regard them as a different populations of a single biological species. It is a common arboreal
species in the monsoon rainforests of Cape York Pen. and the lowland rainforests of the Wet Tropics where it reaches the southern limit of its distribution.

**Polyrhachis viehneyeri** species-group

**Polyrhachis (Myrmthrinax) rusticata**

Kohout, 1990

*Polyrhachis rusticata* Kohout, 1990: 505.

**Remarks.** The holotype of this species was described from Collinsville and the above specimen represents the only record from the Wet Tropics. These ants apparently co-exist in the nests of other ants, namely *Rhytidoponera* spp. (Kohout, 1990:499-508) and this behaviour is presently under investigation by Drs Alfred Buschinger (Darmstadt) and Ulrich Maschwitz (Frankfurt am Main) (pers. comm.).

Subgenus **Myrmthrinax** Forel, 1915

**Polyrhachis (Myrmthrinax) delicata**

Crawley, 1915

*Polyrhachis delicata* Crawley, 1915: 238.

**Remarks.** This species ranges south from New Guinea to northern Queensland. Its nesting habits are identical to the closely related *P. delicata*, however, *P. queenslandica* is much less common.

Genus **Echinopla** Fr. Smith, 1857

**Echinopla australis** Forel, 1901

(Fig. 4K)

*Echinopla australis* Forel, 1901b: 75.

**Remarks.** *Echinopla australis* is predominantly a rainforest species. However a colony from Pilgrim Sands was nesting in a dry hollow seedpod of *Calophyllum inophyllum* on the beach front. It occurs from New Guinea south to near Mackay.

**Echinopla turneri** Forel, 1901

*Echinopla turneri* Forel, 1901b: 76.

**Remarks.** *Echinopla turneri* is also a rainforest species, nesting mostly in hollow twigs and small branches. It ranges from the Paluma R. south to Yeppoon. Distinguishing characters of both *Echinopla* species, together with notes on their distribution and biology, were given by Taylor, 1992: 60-61.

**Acknowledgements.**

I am grateful to Dr Simon K.A. Robson of the School of Tropical Biology, James Cook University, Townsville, for the steady supply of *Polyrhachis* from the Queensland tropics and for making available funds from his Australian
Research Council grant to support my field work in north Queensland. He also loaned photographs of nests. I thank the Australian Biological Resources Study for a grant to support my work. Photographs of living ants were taken by Queensland Museum photographer, Jeff Wright. Geoff Thompson kindly prepared the maps. I thank my colleagues from Germany, namely Prof. Alfred Buschinger (Institut für Zoologie, Darmstadt), Prof. Ulrich Maschwitz (J.W. Goethe-Universität, Frankfurt am Main) and Wolfgang H.O. Dorow (Forschungsinstitut Senckenberg, Frankfurt am Main) for the opportunity to join their Queensland field work to study the social parasitism between the Polyrhachis (viehmeyeri-group) and Rhytidoponera species. I thank Drs Steve O. Shattuck and Robert W. Taylor, of the Division of Entomology, CSIRO, Canberra, for unlimited access to the Polyrhachis material in the ANIC and for the loan of specimens included in this study. My sincere thanks also go to my Queensland Museum colleagues, Drs Chris J. Burwell and Geoff B. Monteith, for their valuable support received during the preparation of this paper. Many specimens were collected by Dr Monteith and his colleagues during field work supported over the years by the Australian Research Council, the Wet Tropics Management Authority and the Rainforest CRC. Finally, I thank the curators and other staff of various overseas museums and institutions, listed earlier, for their cooperation in accessing the types and other material in their care. Permits to allow collecting in National Parks and State Forests have been kindly issued by the Environmental Protection Agency and the Department of Natural Resources.
