

***FONSECAHYMEN**

***stigmata**. **Fonsecahymen stigmata* Martins-Neto & Mendes, 2002: 29, pl. 1C, fig. 1E (wing)
BRAZIL (Minas Gerais, Oligocene).

[Note: fig. 1E shows a formicine venation, together with (lower left) the partial venation of a non-hymenopterous wing which is not mentioned in the text. As the fossil is Neotropical the authors' association of it with *Oecophylla* is probably incorrect.]
